## **Montana Department of Natural Resources and Conservation**

## STRUCTURE EVALUATION FORM

Date:
s this assessment being conducted for insurance purposes?   Yes No
f yes, check with your insurance company to determine what form is required by them. This evaluation is advisory only. By completing this evaluation, the MT DNRC accepts no liability for any loss, damage, or injury resulting from a wildfire event.
f you are a wildfire and/or forestry professional: Please ensure this evaluation data is entered into Situation Analysist Montana (SAM) www.samontana.org/, once entered, a risk rating will be identified and you will be able to access various eports. A homeowner report is one of the options. This report includes the evaluation results, risk rating, and educational information on why certain factors are important and what can be done. SAM offers the option of printing the report for the homeowner or copying and pasting the Internet address/link into an email to share with the homeowner.  If you are a property owner: You can utilize this form to evaluate your structure, to determine the risk rating you will need
o request an evaluation be conducted by a wildfire and/or forestry professional, and to request an assessment visit www.dnrc.mt.gov. To receive educational information on why certain factors are important in this evaluation and what can be done, visit www.dnrc.mt.gov.

Affile vial and action and interested to under vial and a limit of the vial of wildful like increases the state

Wildfire risk reduction actions are intended to reduce risk, not eliminate the risk of wildfire. It is important to note that wildfire is a natural and inevitable phenomenon in Montana. It is a dynamic event influenced by several factors including weather (winds, temperature, relative humidity), topography (steepness of a slope, the direction that slope faces, and terrain features such as canyons and saddles), and vegetation, also known as fuels (light or heavy loading, height, continuity, and volatility). Human activity, response times, and seasonal trends also play a role. There will always be some risk of wildfire regardless of actions taken and structural characteristics.

It is important to take steps to prepare your structure and property for wildfires with the mindset that firefighters will not be on site and the actions you take now will increase your homes chances of survival.

This evaluation is designed to identify vulnerabilities around the structure. In a wildfire situation, structure ignitions can occur in multiple ways, including:

- 1. Firebrands or ember-wash This is the most common way that homes ignite during a wildfire. Wildfires may produce high winds that loft burning fuel particles up to a mile ahead of a fire. This often explains how fires grow so quickly. Closer to the fire, small embers swirl around like a blizzard and accumulate in corners and crevices. These may ignite combustible materials such as needles, leaves, wooden decks, siding, or enter through gaps, cracks, or vents in an attic, soffit, or crawlspace to ignite combustible materials within.
- 2. Radiant & convective heat When intense enough, heat produced by a fire will ignite the home or preheat siding and other materials which then ignites more readily when in direct contact with flame or embers.
- 3. **Direct flame** Vegetation or fuels near the home ignite, subsequently igniting the home.

ACCESS					
Address visible from the road:  Yes No  Adequate turnaround: Yes No	Community ingress/egress:  Two or more roads in/out One road in/out  Width of driveway: Inaccessible 12 feet or less 13 feet or more	Length of driveway:  ☐ Inaccessible ☐ < 50 feet ☐ 50 - 150 feet ☐ 150 - 500 feet ☐ 500 feet or more			
Locked gate:  ☐ No ☐ Yes. Fire dept. has access ☐ Yes. Fire dept. does not have access	Bridge or weight limits:  ☐ Yes ☐ No ☐ Unknown ☐ Not Applicable
